

Gastroesophageal Carcinoma

Esophageal cancer is cancer arising from the esophagus, the food pipe that runs between the throat and the stomach. Symptoms often include difficulty in swallowing. Esophageal cancer is a disease in epidemiologic transition. Until the 1970s, the most common type of esophageal cancer in the United States was squamous cell carcinoma. Gastroesophageal junction adenocarcinoma is a rare type of cancer of the esophagus, the tube that connects your mouth and stomach. It starts at the gastroesophageal junction, where the esophagus meets the stomach. Esophageal cancer is cancer that occurs in the esophagus, a long, hollow tube that runs from your throat to your stomach. Your esophagus. Utilizing an evidence-based approach, this review article provides an overview of the management of gastroesophageal junction carcinomas with particular emphasis on survival rates. Survival rates tell you what portion of people with the same type and stage of cancer are still alive a certain amount of time (usually 5 years). After someone is diagnosed with esophageal cancer, doctors will try to figure out if it has spread, and if so, how far. This process is called staging. Get information about cancers that grow where the food pipe (oesophagus) meets the stomach. These cancers are called gastro oesophageal junction cancers. The incidence of esophageal cancer has risen in recent decades, coinciding with a shift in histologic type and primary tumor location. In the United States, the NCI supports clinical trials studying new and more effective ways to detect and treat cancer. Find treatment clinical trials for esophageal cancer. Gastroesophageal cancer (GEC), comprising proximal esophagogastric junction (EGJ) and distal gastric cancer (GC), is a significant public health problem. Esophageal cancer is a relatively rare cancer. It is most often diagnosed in people over the age of 65. The majority of cancers are either adenocarcinoma or squamous cell carcinoma.
